**Information Technology – Geographic Information  
Framework Data Content Standard  
Part 3: Elevation**

**CAUTION NOTICE**

**This standard document may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Users of American National Standards may receive current information on all standards by contacting the American National Standards institute (ANSI).**

34 Secretariat:  
35 INFORMATION TECHNOLOGY INDUSTRY COUNCIL  
36 Approved:  
37 YEAR-MM  
38 **American National Standards Institute**

39 **American**  
40 **National**  
41 **Standard**

66 Approval of an American National Standard requires verification by the  
67 American National Standards Institute (ANSI) that the requirements for due  
68 process, consensus, and other criteria for approval have been met by the  
69 standards developer.  
70  
71 Consensus is established when, in the judgment of the ANSI Board of  
72 Standards review, substantial agreement has been reached by directly and  
73 materially affected interests. Substantial agreement means much more than  
74 a simple majority, but not necessarily unanimity. Consensus requires that  
75 all views and objections be considered, and that a concerted effort be made  
76 toward their resolution.  
77  
78 The use of American National Standards is completely voluntary; their  
79 existence does not in any respect preclude anyone, whether he or she has  
80 approved the standards or not, from manufacturing, marketing, purchasing,  
81 or using products, processes, or procedures not conforming to the standards.  
82  
83 The American National Standards Institute does not develop standards and  
84 will in no circumstances give an interpretation of any American National  
85 Standard. Moreover, no person shall have the right or authority to issue an  
86 interpretation of an American National Standard in the name of the  
87 American National Standards Institute. Request for interpretations should  
88 be addressed to the secretariat or sponsor whose name appears on the title  
89 page of this standard.

264 **Foreword**

265 Geographic information, also known as geospatial information, both underlies and is the subject  
266 of much of the political, economic, environmental, and security activities of the United States. In  
267 recognition of this, the United States Office of Management and Budget issued Circular A-16  
268 (revised 2002), which established the Federal Geographic Data Committee (FGDC) as a  
269 coordinating organization.

270 Work on this standard started under the Geospatial One-Stop e-Government initiative. The  
271 standard was developed with the support of the member agencies and organizations of the  
272 FGDC and aids in fulfilling a primary objective of the National Spatial Data Infrastructure (NSDI),  
273 that is, creation of common geographic base data for seven critical data themes. The seven core  
274 data themes are considered framework data of critical importance to the spatial data  
275 infrastructure.

276 The increasing need to coordinate collection of new data, identify applicability of existing data,  
277 and exchange data at the national level led to the submission of this standard to the ANSI  
278 process to become an American National Standard. The national standard contained in this  
279 document and its parts was sponsored by Technical Committee L1, Geographic Information  
280 Systems, of the InterNational Committee for Information Technology Standards (INCITS), an  
281 ANSI-accredited standards development organization.

282 As the Geographic Information Framework Data Content Standard was developed using public  
283 funds, the U.S. Government will be free to publish and distribute its contents to the public, as  
284 provided through the Freedom of Information Act (FOIA), Part 5 United States Code, Section 552,  
285 as amended by Public Law No. 104-231, "Electronic Freedom of Information Act Amendments of  
286 1996".

287 **Introduction**

288 The primary purpose of this part of the Geospatial Information Framework Data Content  
289 Standard is to describe content of geospatial elevation data models to support of the exchange of  
290 elevation information. This part seeks to establish a common baseline for the semantic content of  
291 elevation databases for public agencies and private enterprises. It also seeks to decrease the  
292 costs and simplify the exchange of elevation data among local, Tribal, State, and Federal users  
293 and producers. That, in turn, discourages duplicative data collection. Benefits of adopting this  
294 part of the standard also include the long-term improvement of the geospatial elevation data  
295 within the community.

296

## 297 **Framework Data Content Standard – Elevation**

### 298 **1 Scope, purpose, and application**

299 The Elevation part of the Framework Data Content Standard defines the geospatial data model  
300 entities and attributes that permit the exchange of digital elevation data consistent with the  
301 National Spatial Data Infrastructure's (NSDI) framework for elevation data. This part of the  
302 standard is consistent with ISO 19123 Geographic Information – Schema for Coverage Geometry  
303 and Functions and the OGC 03-065r6 Abstract Specification for Coverage Type and its Subtypes.  
304 The part includes an application schema expressed in the Unified Modeling Language (UML).

305 The Elevation part identifies the geospatial data model elements required for digital elevation data  
306 to be used for the NSDI framework. The part was written to be inclusive of the common  
307 geospatial elevation data models (point, grid, contour, triangulated irregular network, and profile)  
308 and to not restrict anyone wishing to contribute their elevation data to the NSDI. The part  
309 supports both topographic elevation data (above a reference datum) and bathymetric elevation  
310 data (below a reference datum). Collecting and sharing NSDI digital elevation data that are  
311 consistent with this part of the standard will assure a common understanding of the data  
312 throughout the user community. Furthermore, the principles described in this standard may be  
313 extended to other geographic entities to facilitate the exchange of other geospatial thematic data.

### 314 **2 Conformance**

315 Each geospatial elevation model of the Elevation part includes a data dictionary based on the  
316 conceptual application schema presented in that model. To conform to this part of the  
317 Framework Data Content Standard, an elevation dataset shall satisfy the requirements of the  
318 data dictionary for that geospatial data model.

### 319 **3 Normative references**

320 Annex A of the Base Document (Part 0) lists normative references applicable to two or more parts  
321 of the standard. Informative references applicable only to the Elevation part are listed in Annex  
322 C. Annex D of the Base Document lists informative references applicable to two or more of the  
323 parts.

### 324 **4 Maintenance authority**

#### 325 **4.1 Level of responsibility**

326 The FGDC is the responsible organization for coordinating work on all parts of the Geographic  
327 Information Framework Data Content Standard. The U.S. Department of the Interior, United  
328 States Geological Survey (USGS), National Geospatial Programs Office, working with the FGDC,  
329 is directly responsible for development and maintenance of the Geographic Information  
330 Framework Data Content Standard, Part 3: Elevation.

331 The FGDC shall be the sole organization responsible for direct coordination with the InterNational  
332 Committee for Information Technology Standards (INCITS) concerning any maintenance or any  
333 other requirements mandated by INCITS or ANSI.

#### 334 **4.2 Contact information**

335 Address questions concerning this part of the standard to:

336 Federal Geographic Data Committee Secretariat  
337 c/o U.S. Geological Survey  
338 590 National Center  
339 Reston, Virginia 20192 USA

340 Telephone: (703) 648-5514  
341 Facsimile: (703) 648-5755

342 Internet (electronic mail): [gdc@fgdc.gov](mailto:gdc@fgdc.gov)  
343 WWW Home Page: <http://fgdc.gov>

344 Or

345 Associate Director for Geographic Information  
346 United States Geological Survey, MS 108  
347 12201 Sunrise Valley Drive  
348 Reston, VA 20192

349 Telephone: (703) 648-5747

## 351 **5 Terms and definitions**

352 Definitions applicable to the Elevation part are listed below. More general terms and definitions  
353 can be found in the Base Document (Part 0). Users are advised to consult that part for a  
354 complete set of definitions.

### 355 **5.1** 356 **coordinate reference system**

357 coordinate system which is related to the real world by a datum [ISO 19111]

### 358 **5.2** 359 **coverage**

360 feature that acts as a function to return values from its range for any direct position within its  
361 spatial, temporal, or spatiotemporal domain [ISO 19123]

362 EXAMPLES A raster image, a polygon overlay, or a digital elevation matrix.

### 363 **5.3** 364 **coverage geometry**

365 configuration of the domain of a **coverage** described in terms of coordinates [ISO 19123]

### 366 **5.4** 367 **direct position**

368 position described by a single set of coordinates within a **coordinate reference system** [ISO  
369 19107]

### 370 **5.5** 371 **elevation**

372 distance measured upward along a plumb line between a point and the geoid

373 NOTE The elevation of a point is normally the same as its orthometric height. This is the “official”  
374 geodesy definition of elevation, but the term “elevation” is also used more generally for height above a  
375 specific vertical reference, not always the geoid.

### 376 **5.6** 377 **geometry value pair**

378 ordered pair composed of a **spatial object**, a temporal object, or a **spatiotemporal object** and a  
379 **record** of feature attribute values [ISO 19123]

### 380 **5.7** 381 **grid**

382 network composed of two or more sets of curves in which the members of each set intersect the  
383 members of the other sets in an algorithmic way [ISO 19123]

- 384 NOTE The curves partition a space into grid cells.
- 385 **5.8**  
386 **line segment**  
387 straight line between two points
- 388 **5.9**  
389 **point coverage**  
390 **coverage** that has a domain composed of points [ISO 19123]
- 391 **5.10**  
392 **range**  
393 set of feature attribute values associated by a function with the elements of the domain of a  
394 **coverage**
- 395 **5.11**  
396 **record**  
397 finite, named collection of related items (objects or values) [ISO 19107]  
398 NOTE Logically, a record is a set of pairs <name, item>.
- 399 **5.12**  
400 **spatial object**  
401 object used for representing a spatial characteristic of a feature [ISO 19107]
- 402 **5.13**  
403 **tessellation**  
404 partitioning of a space into a set of conterminous **spatial object**, temporal object, or  
405 **spatiotemporal object** having the same dimension as the space being partitioned [ISO 19123]  
406 NOTE A tessellation composed of congruent regular polygons or polyhedra is a regular tessellation.  
407 One composed of regular, but non-congruent polygons or polyhedra is a semi-regular tessellation.  
408 Otherwise the tessellation is irregular.
- 409 **5.14**  
410 **triangulated irregular network**  
411 **TIN**  
412 **tessellation** composed of triangles [ISO 19123]
- 413 **5.15**  
414 **vector**  
415 quantity having direction as well as magnitude [ISO 19123]  
416 NOTE A directed line segment represents a vector if the length and direction of the line segment are  
417 equal to the magnitude and direction of the vector. The term vector data refers to data that represents the  
418 spatial configuration of features as a set of directed line segments.
- 419 **6 Symbols, abbreviated terms, and notations**  
420 The following symbols, abbreviations, and notations are applicable to the Elevation part.  
421 Symbols, abbreviated terms, and notations applicable to multiple parts are listed in the Base  
422 Document (Part 0).  
423 3D – 3-dimensional

424 LIDAR – Light Detection and Ranging

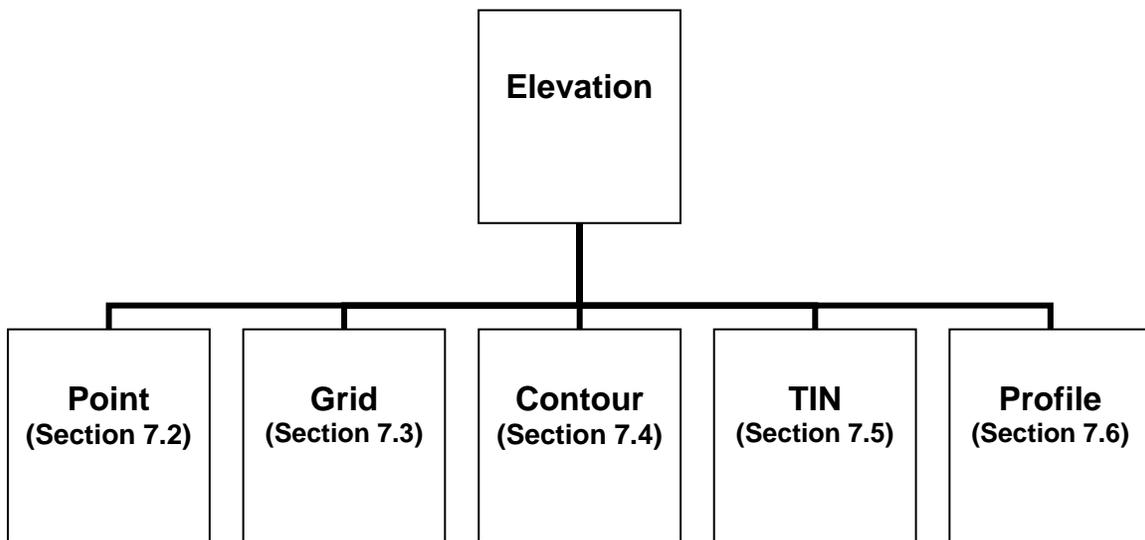

425 TIN – Triangulated Irregular Network

## 426 7 Requirements

### 427 7.1 General

428 This standard models elevation data as a geospatial data coverage within the context of five  
429 geospatial data models: Point, Grid, TIN, Contour, and Profile as shown in Figure 1.  
430 Specifications, defined in this standard, accommodate the level of content and relationships  
431 necessary for exchange of all forms and formats of these data in a predictable and repeatable  
432 manner.

433

434

435

436

Figure 1 – Elevation

437

438 Definitions for, and characteristics of, digital elevation data may be specific to these individual  
439 data models, or they may apply to all five geospatial data models. Appendix B provides the  
440 application schema for each of these geospatial elevation data models. The National Digital  
441 Elevation Program ([www.ndep.gov](http://www.ndep.gov)) has developed a set of Guidelines for Digital Elevation Data  
442 that describe and provide best practices and examples for each of these geospatial data models.

### 443 7.2 Point

444 Points are the most basic geospatial elevation data model used for modeling terrain and  
445 bathymetric elevation data. Points are usually represented by a collection of irregularly, or non-  
446 uniformly organized geometry coordinate sets as shown in Figure 2. Each point is identified by a  
447 horizontal coordinate geometry pair (X,Y) and an vertical coordinate elevation value (Z). The  
448 elevation value (Z) may be explicitly encoded as a triplet (X, Y, Z), known as an ElevationPointSet  
449 (see section A.12 for the ElevationPointSet UML application schema and B.7 for the  
450 ElevationPointSet UML object description) or as an attribute value to the X,Y geometry pair,  
451 known as an ElevationPointCoverage (see section A.6 for the ElevationPointCoverage UML  
452 application schema and B.4 for the ElevationPointCoverage UML object description). Point  
453 coverage attribution could include identification such as a control point reference, reference to the  
454 type of surface to which the point applies, or other characteristics specific to the point. The order  
455 (if applicable) and definition of these additional attributes shall be specified in the metadata.

456 While points are not necessarily presented in a uniform or structured pattern, they often are  
457 acquired in a systematic distribution, which is intended to facilitate accurate representation of the  
458 surface or features the data are intended to model. When generated manually, points are ideally  
459 chosen so that subtle terrain characteristics, such as gradual variations in slope or aspect, or  
460 distinct features such as a levee or river embankment are adequately represented in the data.  
461 However, when generated automatically, such as through the use of an active sensing system  
462 (LIDAR), point distribution depends upon the characteristics of the sensor used to acquire the  
463 data, and its performance in different terrain and land cover types.

481

### 7.3 Grid

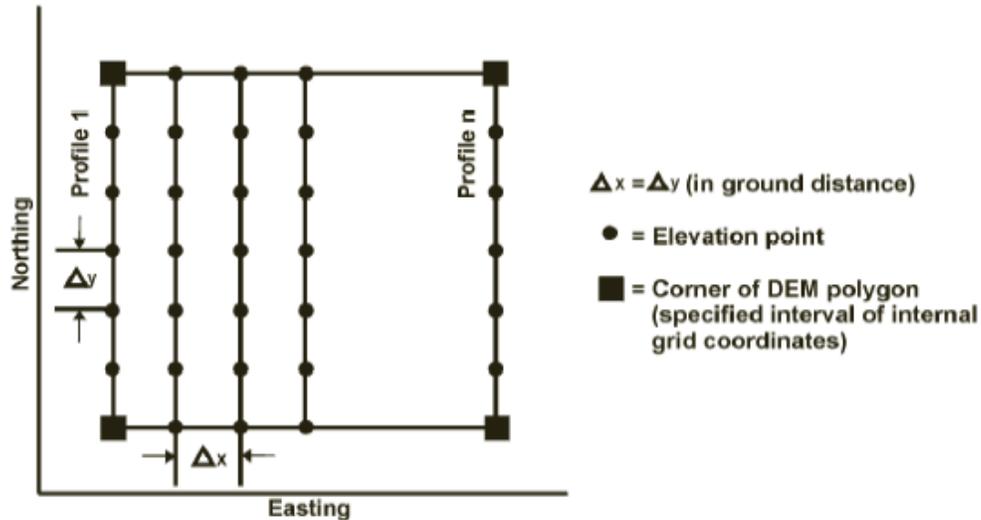

482

483 Grids are the most common geospatial data model used for modeling terrain and bathymetric  
484 elevation data. Grids are represented by a collection of regularly or uniformly organized points as  
485 shown in Figure 3. There are several advantages to grids over other types of elevation  
486 geospatial data models. A regular spacing of elevations requires that only one point be  
487 referenced to a horizontal coordinate. From this point, in conjunction with coordinate referencing  
488 information supplied with the grid, the horizontal location of all other points can be determined.  
489 This eliminates the need to explicitly define the horizontal geometry coordinate pairs of each  
490 elevation and minimizes file size. The grid is also an efficient structure for data processing. See  
491 section A.4 for the ElevationGridCoverage UML application schema and B.3 for the  
ElevationGridCoverage UML object description.

492

493 The spacing within the grid can be chosen to most efficiently represent the size and frequency of  
494 terrain undulations to be modeled. For example, rough or dissected terrain may require small,  
495 narrow grid spacing, while gentle relief may be adequately modeled with fairly wide grid spacing.  
496 Grids may not model all terrain features smaller or narrower than the grid spacing when the  
feature lies between grid points.

497

498

499

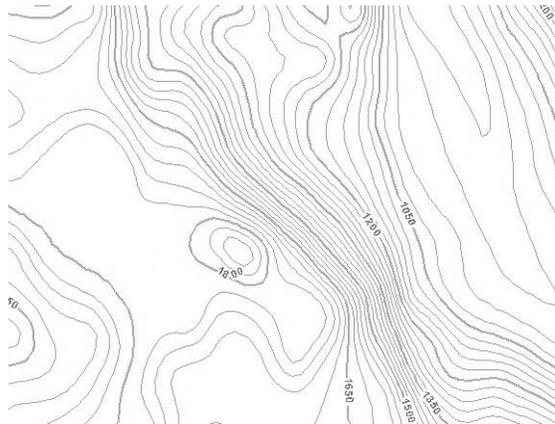

Figure 3 – Example: Grid

#### 500 7.4 Contour

501 Three-dimensional vector modeling supports the exchange of constant-elevation features, also  
502 referred to as hypsography or contours. See section A.10 for the ElevationContourCoverage  
503 UML application schema and B.6 for the ElevationContourCoverage UML object description.

504 Contours are vectors connecting points of equal elevation and are a common visual  
505 representation of topography and bathymetry in mapping applications as shown in Figure 4. The  
506 density of x, y coordinate geometry pairs (vertices) along a contour vector are dependent on the  
507 characteristics and complexity of the terrain.

508

509

510

511

Figure 4 – Example: Contours

512

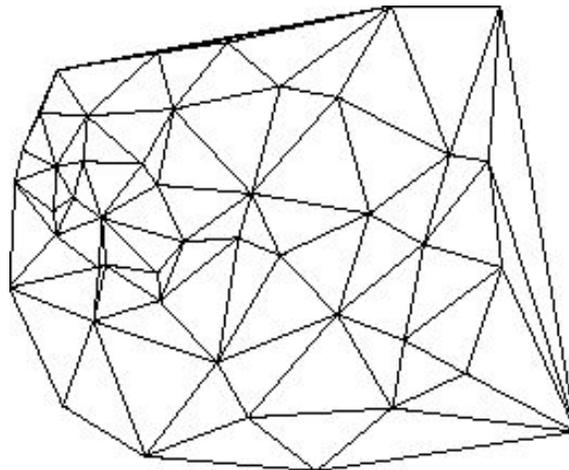

#### 513 7.5 Triangulated irregular network (TIN)

514 A fundamental data structure frequently used to model points from photogrammetry and LIDAR  
515 collection is the triangulated irregular network (TIN). TINs are surface representations derived  
516 from irregularly spaced sample points and breakline features (surface discontinuities such as

517 peaks, pits, ridges, and valleys). The main components of a TIN are nodes, edges, and triangles,  
518 which are linked by topological structure. TIN datasets include topological relationships between  
519 points and their neighboring triangles. Each sample point has an x,y coordinate geometry pair  
520 and a surface, or z-value. These points are connected by edges to form a set of non-overlapping  
521 triangles used to represent the surface as shown in Figure 5. See section A.8 for the  
522 ElevationTINCoverage UML application schema and B.5 for the ElevationTINCoverage UML  
523 object description.

524 TINs are used many times when it is necessary to capture or show complex topographic  
525 elevation surfaces. TINs allow for extra data in complex areas and less data in non-complex  
526 areas and enable the use of natural topographic features as breaklines. See Figure 5 for an  
527 example of a triangulated irregular network.

528

529

530

531

**Figure 5 – Example: Triangulated irregular network**

532

## 533 **7.6 Profile**

534 Profiles, also known as breaklines or cross sections (also referred to as transects), are lines that  
535 connect irregularly spaced points of varying elevation values as shown in Figure 6. Profiles are  
536 commonly used to model surface discontinuities such as peaks, pits, ridges, and valleys or may  
537 be used to model the elevation information of other linear features such as transportation or  
538 pipelines. See section A.15 for the ElevationProfile UML application schema and B.8 for the  
539 ElevationProfileCollection UML object description.

540 They are used for specialized applications to represent a string of elevations along a designated  
541 path. Cross sections, which are generally perpendicular to a linear terrain feature, are used for a  
542 variety of engineering applications. For example, a cross section of a stream will show the  
543 stream channel geometry above and below the water surface for hydraulic engineering purposes  
544 and a cross section of a road will show the shape of the road surface including its crown,  
545 shoulders, and ditches.

546 Breaklines are lines that are used to model a relatively abrupt change in the slope or continuity of  
547 a surface slope or aspect. Breaklines may represent surface breaks observed at a constant  
548 elevation or that trend up and down slope.

## Annex A (normative) UML model, Application schema for the exchange of framework elevation data

### 587 A.1 General

588 The model object names and notation conform to the names and notation used by ISO Technical  
589 Committee 211 - Geographic information/Geomatics.

### 590 A.2 ElevationCollection

591

592  
593  
594

Figure A.1 – ElevationCollection

#### 595 A.2.1 Semantics

596 The class ElevationCollection represents a collection of framework elevation data. It inherits the  
597 attribute metadata from the FeatureCollection class specified in the Base Document (Part 0).

#### 598 A.2.2 extent

599 The attribute extent shall describe the geographic area to which the data in the  
600 ElevationCollection applies. The data type EX\_GeographicExtent is specified in ISO 19115.

#### 601 A.2.3 metadata

602 The attribute metadata shall provide a link to metadata that describes the ElevationCollection.

603 **A.2.4 gridSet**

604 The role name *gridSet* shall identify the set of ElevationGridCoverages contained in the  
605 ElevationCollection.

606 **A.2.5 pointSet**

607 The role name *pointSet* shall identify the set of ElevationPointSets contained in the  
608 ElevationCollection.

609 **A.2.6 pointCoverage**

610 The role name *pointCoverage* shall identify the set of ElevationPointCoverages contained in the  
611 ElevationCollection.

612 **A.2.7 contourSet**

613 The role name *contourSet* shall identify the set of ElevationContourCoverages contained in the  
614 ElevationCollection.

615 **A.2.8 tin**

616 The role name *tin* shall identify the set of ElevationTinCoverages contained in the  
617 ElevationCollection.

618 **A.2.9 profileSet**

619 The role name *profileSet* shall identify the set of ElevationProfileCollections contained in the  
620 ElevationCollection.

621 **A.3 ElevationCoverage**

622

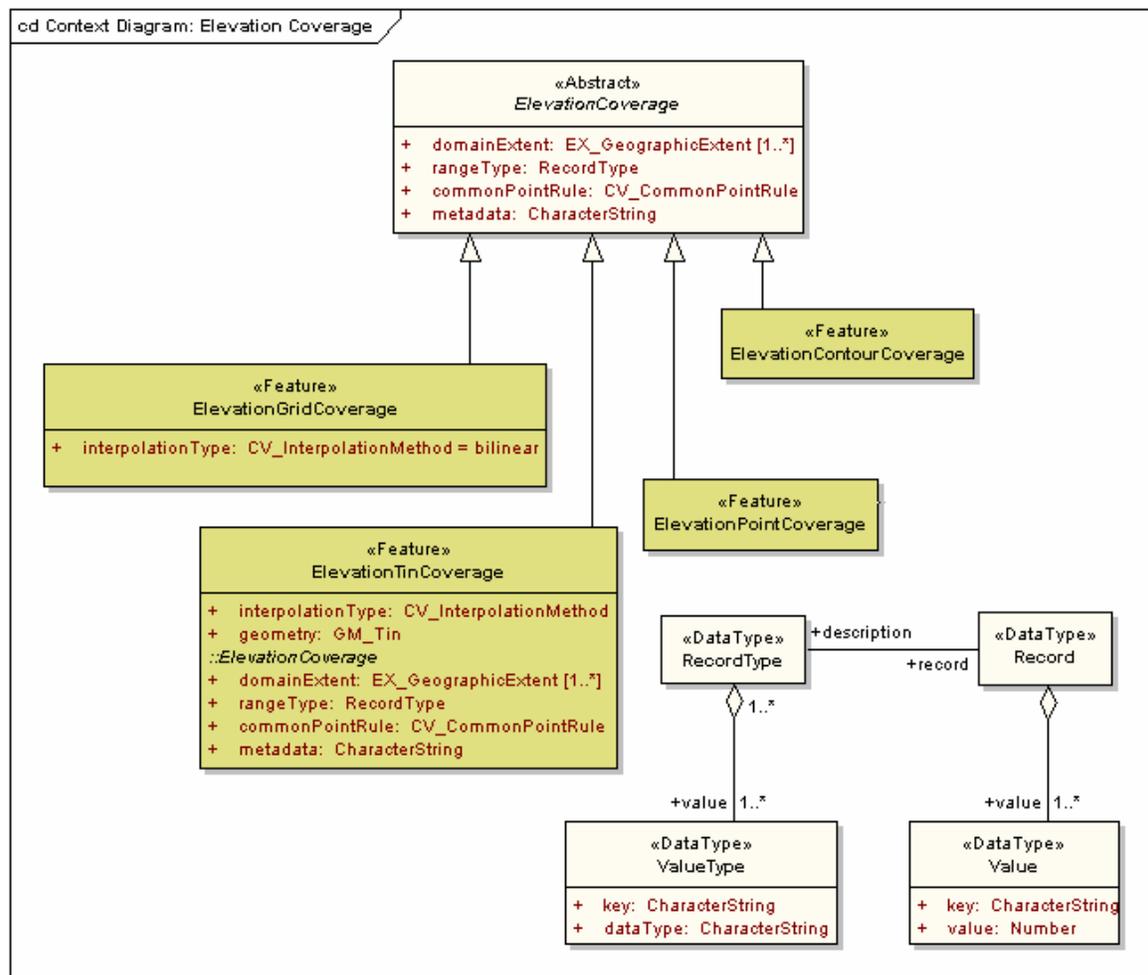

Figure A.2 – ElevationCoverage

623

624

625

626

### A.3.1 Semantics

627

ElevationCoverage is an abstract class that specifies a set of attributes common to all the kinds of coverages that may be contained in an ElevationCollection. It is a realization of the Type CV\_Coverage specified in ISO 19123 and implements attributes specified for that Type. It inherits an association to SC\_CRS from CV\_Coverage. SC\_CRS provides a description of the coordinate reference system including horizontal and vertical datums and units of measure.

632

### A.3.2 domainExtent

633

The attribute *domainExtent* shall describe the spatial extent of the domain of the ElevationCoverage.

635

### A.3.3 rangeType

636

The attribute *rangeType* shall describe the range of the ElevationCoverage. It uses the data type RecordType specified in ISO/TS 19103. An instance of RecordType is a list of name:data type pairs each of which describes an attribute type included in the range of the coverage. The name field shall be used to identify the type of surface that each elevation value describes.

640

EXAMPLE The rangeType for an elevation coverage that includes values for bare earth surface elevation and for reflective surface elevation would have the value "bare earth surface elevation:Real, reflective surface elevation:Real".

642

643 **A.3.4 commonPointRule**

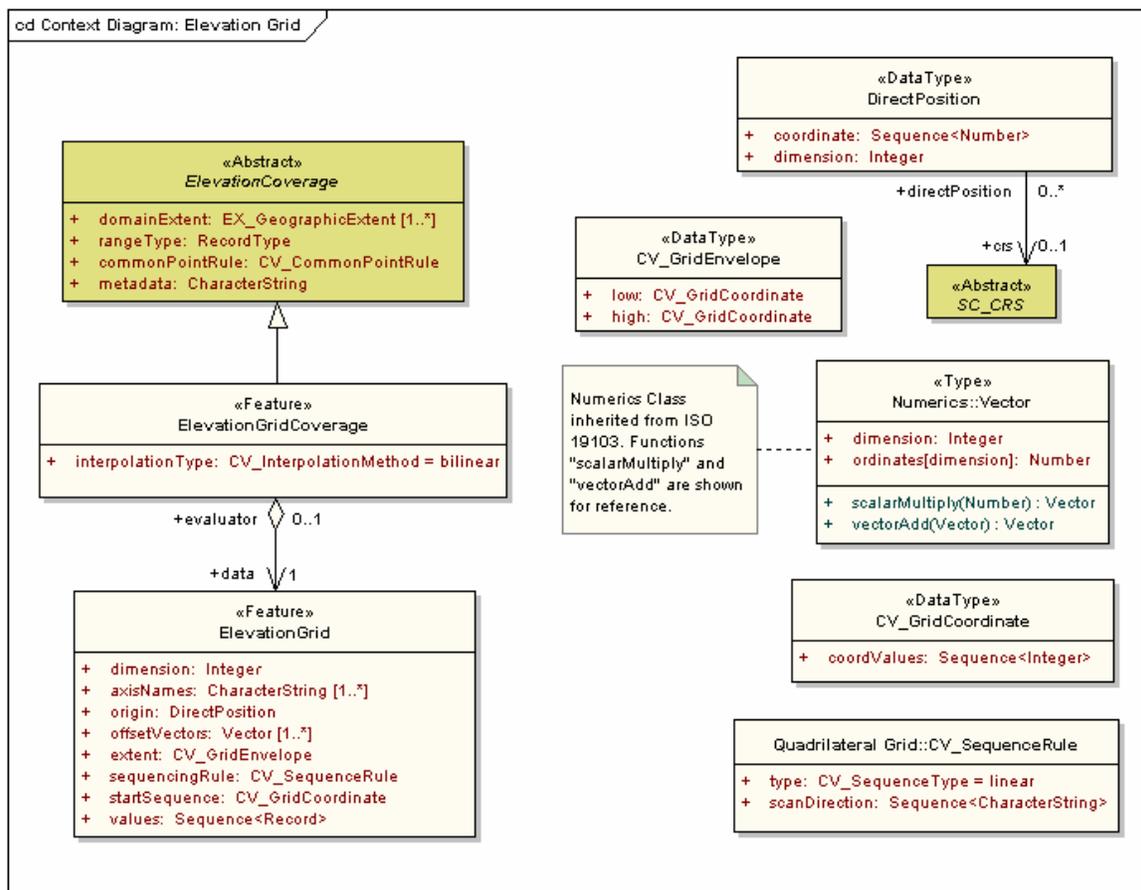

644 The attribute *commonPointRule* shall identify the procedure recommended for evaluating the  
645 ElevationCoverage at a position that falls on a boundary between geometric objects in the  
646 domain of the coverage. It takes a value from the code list CV\_CommonPointRule specified in  
647 ISO 19123. The rule shall be applied to the set of elevation values that results from evaluating  
648 the coverage with respect to each of the geometric objects that share a boundary. For elevation  
649 coverages, appropriate values of CV\_CommonPointRule include “average”, “high”, and “low”.

650 **A.3.5 metadata**

651 The attribute *metadata* shall provide a link to metadata that describes the ElevationCoverage.

652 **A.4 ElevationGridCoverage**

653

654

655

Figure A.3 – ElevationGridCoverage

656

657 **A.4.1 Semantics**

658 The class ElevationGridCoverage is a subclass of ElevationCoverage that represents a set of  
659 elevation values assigned to the points in a 2D grid. The class is a realization of the Type  
660 CV\_ContinuousQuadrilateralGridCoverage specified in ISO 19123 and implements the attributes  
661 and associations specified for that Type as well as those inherited from ElevationCoverage.

662 **A.4.2 interpolationType**

663 The attribute *interpolationType* shall specify the interpolation method recommended for  
664 evaluation of the ElevationGridCoverage. The data type CV\_InterpolationMethod is a code list  
665 specified in ISO 19123. For an ElevationGridCoverage, the value shall be either “bilinear” or  
666 “bicubic”.

667 **A.4.3 data**

668 The role name *data* shall identify the ElevationGrid that contains the values of the  
669 ElevationGridCoverage.

670 **A.5 ElevationGrid**

671 **A.5.1 Semantics**

672 The class ElevationGrid represents the data content of an ElevationGridCoverage. It is a  
673 realization of two Types specified in ISO 19123: CV\_RectifiedGrid and CV\_GridValuesMatrix. As  
674 such, it implements the attributes of both of these Types.

675 **A.5.2 dimension**

676 The attribute *dimension* shall specify the dimension of the ElevationGrid. Its value shall be two  
677 for all instances of ElevationGrid.

678 **A.5.3 axisNames**

679 The attribute *axisNames* shall list the names of the grid axes, one of each dimension of the grid.

680 EXAMPLES “north”, “east” or “latitude”, “longitude”.

681 **A.5.4 origin**

682 The attribute *origin* shall provide the coordinates of the grid origin with respect to an external  
683 coordinate reference system. The data type DirectPosition, specified in ISO 19107, has an  
684 association through the role name coordinateReferenceSystem to the class SC\_CRS specified in  
685 ISO 19111. This association shall be used to identify the external coordinate reference system  
686 for the ElevationGrid. The external coordinate reference system for the ElevationGrid shall be the  
687 coordinate reference system identified by the association from ElevationCoverage to SC\_CRS.

688 **A.5.5 offsetVectors**

689 The attribute *offsetVectors* shall specify both the spacing between grid points and the orientation  
690 of the grid axes with respect to the external coordinate reference system identified through the  
691 attribute *origin*. It uses the data type Vector specified in ISO/TS 19103.

692 **A.5.6 extent**

693 The attribute *extent* shall identify the area of the grid for which elevation data are provided. It  
694 uses the data type CV\_GridEnvelope specified in ISO 19123 to provide both the  
695 CV\_GridCoordinates of the corner of that area having the lowest grid coordinate values and the  
696 CV\_GridCoordinates of the corner of that area having the highest grid coordinate values.  
697 CV\_GridCoordinate is also specified in ISO 19123.

698 **A.5.7 sequencingRule**

699 The attribute *sequencingRule* shall identify the method to be used to assign values from the  
700 sequence of elevation values to grid coordinates. It uses the data type CV\_SequenceRule  
701 specified in ISO 19123.

702 **A.5.8 startSequence**

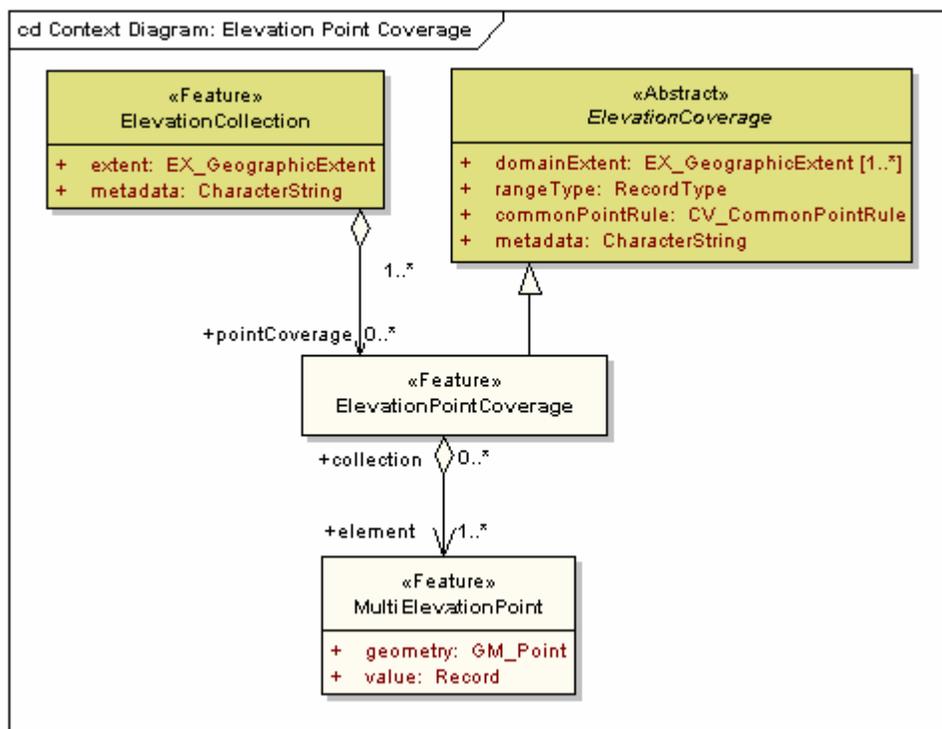

703 The attribute *startSequence* shall use a value of CV\_GridCoordinate to specify the grid  
704 coordinates of the grid point to which the first in the sequence of elevation values is to be  
705 assigned.

706 **A.5.9 values**

707 The role name *values* shall identify a sequence of Records each containing one or more elevation  
708 values to be assigned to a single grid point. Each Record shall conform to the RecordType  
709 specified by the *rangeType* attribute of the ElevationGridCoverage with which the ElevationGrid is  
710 associated.

711 **A.6 ElevationPointCoverage**

712

713

714

Figure A.4 – ElevationPointCoverage

715

716 **A.6.1 Semantics**

717 The class ElevationPointCoverage is a subclass of ElevationCoverage and a realization of the  
718 Type CV\_DiscretePointCoverage specified in ISO 19123. It is an aggregation of points, each of  
719 which is associated with one or more elevation values carried as attributes rather than as  
720 coordinates. It implements the attributes and associations inherited from ElevationCoverage as  
721 well as those specified for CV\_DiscretePointCoverage in ISO 19123.

722 **A.6.2 element**

723 The role name *element* shall identify the set of MultiElevationPoints contained in the  
724 ElevationPointCoverage.

725 **A.7 MultiElevationPoint**

726 **A.7.1 Semantics**

727 The class MultiElevationPoint is a realization of the Type CV\_PointValuePair specified in ISO  
728 19123. It represents a point that has a Record of one or more elevation values associated with it.

729 **A.7.2 geometry**

730 The attribute *geometry* shall contain an instance of GM\_Point as specified in ISO 19107. The  
 731 position of the GM\_Point shall be stated with reference to a 2-dimensional coordinate reference  
 732 system.

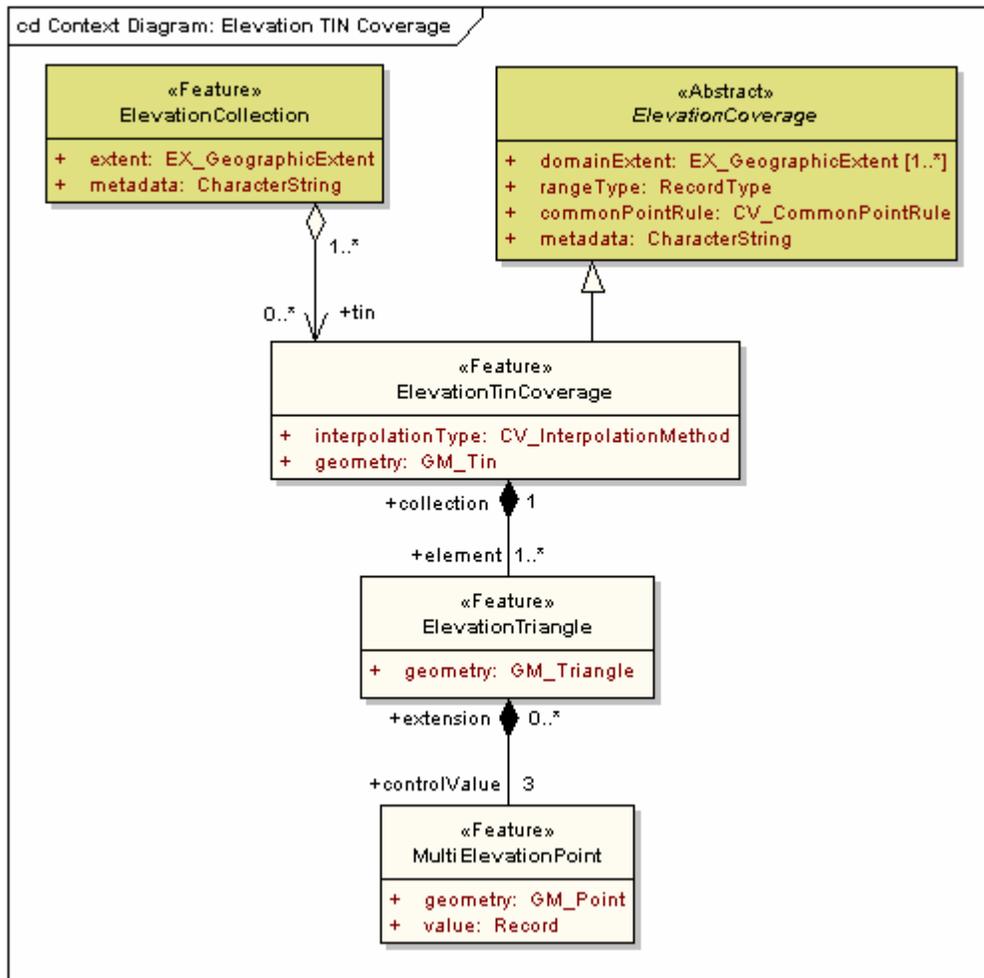

733 NOTE Elevation values are carried as attributes of the point rather than as coordinate values.

734 **A.7.3 value**

735 The attribute *value* shall be a Record that contains one or more elevation values as specified by  
 736 the *rangeType* attribute inherited from ElevationCoverage.

737 **A.8 ElevationTinCoverage**

738

739

740

Figure A.5 – ElevationTinCoverage

741

742 **A.8.1 Semantics**

743 The class ElevationTinCoverage is a realization of the Type CV\_TinCoverage specified in ISO  
 744 19123. It is an aggregation of ElevationTriangles that represents a triangulated irregular network  
 745 in which the points of known elevation fall on the vertices of the triangles. It is also a subclass of  
 746 ElevationCoverage that inherits the attributes specified for that class.

747 **A.8.2 interpolationType**

748 The attribute *interpolationType* shall specify the interpolation method recommended for  
749 evaluation of the ElevationTinCoverage. The data type CV\_InterpolationMethod is a code list  
750 specified in ISO 19123. For an ElevationTinCoverage, the value shall be “barycentric”.

751 **A.8.3 geometry**

752 The attribute *geometry* shall contain the network of triangles that form the basis of the TIN. The  
753 class GM\_Tin is specified in ISO 19107. The triangles shall lie on a 2-dimensional surface; the  
754 elevation values at the vertices are treated as attributes of the points, not as coordinate values.

755 **A.8.4 element**

756 The role name *element* shall identify the set of ElevationTriangles contained in the  
757 ElevationTinCoverage.

758 **A.9 ElevationTriangle**

759 The class ElevationTriangle is a realization of the Type CV\_ValueTriangle specified in ISO  
760 19123. It represents one of the triangles of the TIN and the elevation values associated with the  
761 vertices of that triangle.

762 **A.9.1 geometry**

763 The attribute *geometry* shall contain the GM\_Triangle that is the basis of the ElevationTriangle.  
764 The class GM\_Triangle is specified in ISO 19107. Each instance of *geometry* is an instance of  
765 GM\_Triangle identified by the *patch* attribute of the GM\_Tin that is the value of the *geometry*  
766 attribute of ElevationTinCoverage.

767 **A.9.2 collection**

768 The role name *collection* shall identify the ElevationTinCoverage to which the ElevationTriangle  
769 belongs.

770 **A.9.3 control value**

771 The role name *controlValue* shall identify the set of ElevationPoints at the vertices of the  
772 ElevationTriangle.

773 **A.9.4 MultiElevationPoint**

774 The class MultiElevationPoint is described in A.6. The value of the *geometry* attribute of  
775 ElevationPoint equals one of the values of the attribute *controlPoint* of the GM\_Tin that is the  
776 value of the *geometry* attribute of the ElevationTinCoverage to which the ElevationTriangle  
777 belongs.

778 **A.10 ElevationContourCoverage**

779

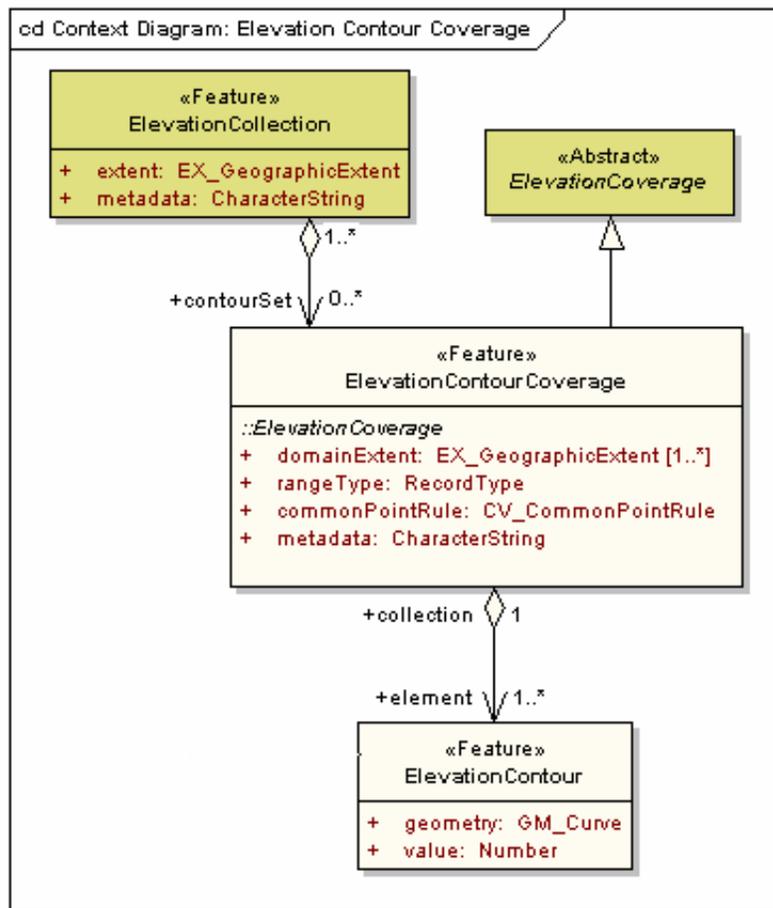

Figure A.6 – ElevationContourCoverage

780

781

782

### 783 A.10.1 Semantics

784 The class ElevationContourCoverage is a realization of the Type CV\_DiscreteCoverage specified  
785 in ISO 19123 that represents a set of elevation contours. It is also a subclass of  
786 ElevationCoverage that inherits the attributes specified for that class.

### 787 A.10.2 element

788 The role name *element* identifies the set of ElevationContours contained in the  
789 ElevationContourCoverage.

## 790 A.11 ElevationContour

### 791 A.11.1 Semantics

792 The class ElevationContour is a realization of the Type CV\_CurveValuePair specified in ISO  
793 19123. It has two attributes.

### 794 A.11.2 geometry

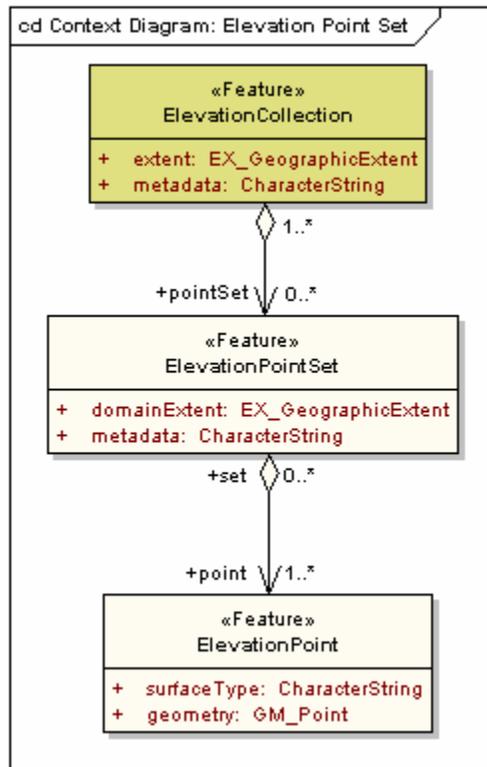

795 The attribute *geometry* shall contain the instance of GM\_Curve that describes the shape of the  
796 contour. The position of the curve is stated with respect to a 2D coordinate reference3 system.

### 797 A.11.3 value

798 The attribute *value* shall contain a Record consisting of the elevation value associated with the  
799 curve.

800 **A.12 ElevationPointSet**

801

802 **Figure A.7 – ElevationPointSet**

803

804

805 **A.12.1 Semantics**

806 The class *ElevationPointSet* represents a collection of points each related to a 3D coordinate  
807 reference system such that the elevation value is carried as one of the coordinates rather than as  
808 a distinct attribute of the point.

809 **A.12.2 domainExtent**

810 The attribute *domainExtent* shall specify the spatial extent of the area to which the  
811 *ElevationPointSet* applies.

812 **A.12.3 point**

813 The role name *point* shall identify the *ElevationPoints* contained in the *ElevationPointSet*.

814 **A.12.4 metadata**

815 The attribute *metadata* shall provide a link to metadata that describes the *ElevationPointSet*.

816 **A.13 ElevationPoint**

817 **A.13.1 Semantics**

818 The class *ElevationPoint* represents a point associated with a single elevation surface. Unlike the  
819 *MultiElevationPoints* of an *ElevationPointCoverage*, each *ElevationPoint* in an *ElevationPointSet*  
820 has only one elevation value and represents only one elevation surface type.

821 **A.13.2 surfaceType**

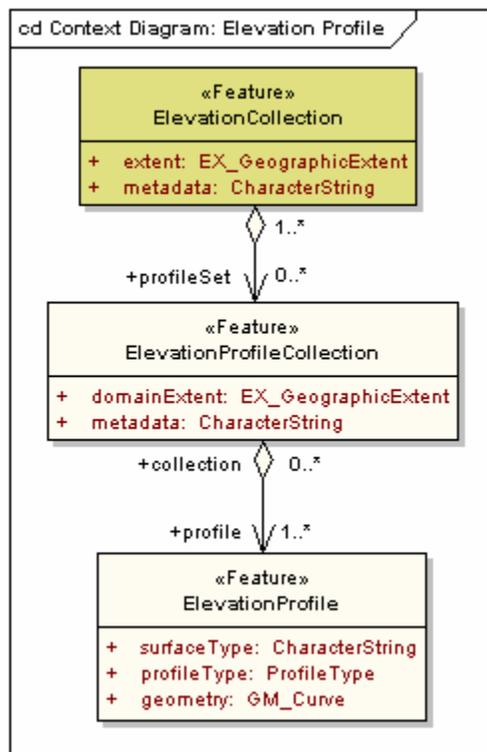

822 The attribute *surfaceType* shall identify the type of surface that is described by the ElevationPoint.

823 **A.13.3 geometry**

824 The attribute *geometry* shall contain an instance of GM\_Point. The position of the point shall be  
825 described in terms of a 3D coordinate reference system. One of the coordinates shall be the  
826 value for the elevation.

827 **A.14 ElevationProfileCollection**

828

829

830

**Figure A.8 – ElevationProfileCollection**

831

832 **A.14.1 Semantics**

833 The class ElevationProfileCollection is an aggregation of ElevationProfiles.

834 **A.14.2 domainExtent**

835 The attribute *domainExtent* shall specify the spatial extent of the area to which the  
836 ElevationProfileCollection applies.

837 **A.14.3 metadata**

838 The attribute *metadata* shall provide a link to metadata that describes the  
839 ElevationProfileCollection.

840 **A.14.4 profile**

841 The role name *profile* shall identify the set of ElevationProfiles that is contained in the  
842 ElevationProfileCollection.

843 **A.15 ElevationProfile**

844 **A.15.1 Semantics**

845 The class ElevationProfile represents a curve lying on an elevation surface. It is a realization of  
846 the Type GM\_Curve specified in ISO 19107, which is an aggregation of GM\_CurveSegments.

847 **A.15.2 surfaceType**

848 The attribute *surfaceType* shall identify the type of surface that the elevation values describe.  
849 The data type CharacterString is specified in ISO/TS 19103.

850 **A.15.3 profileType**

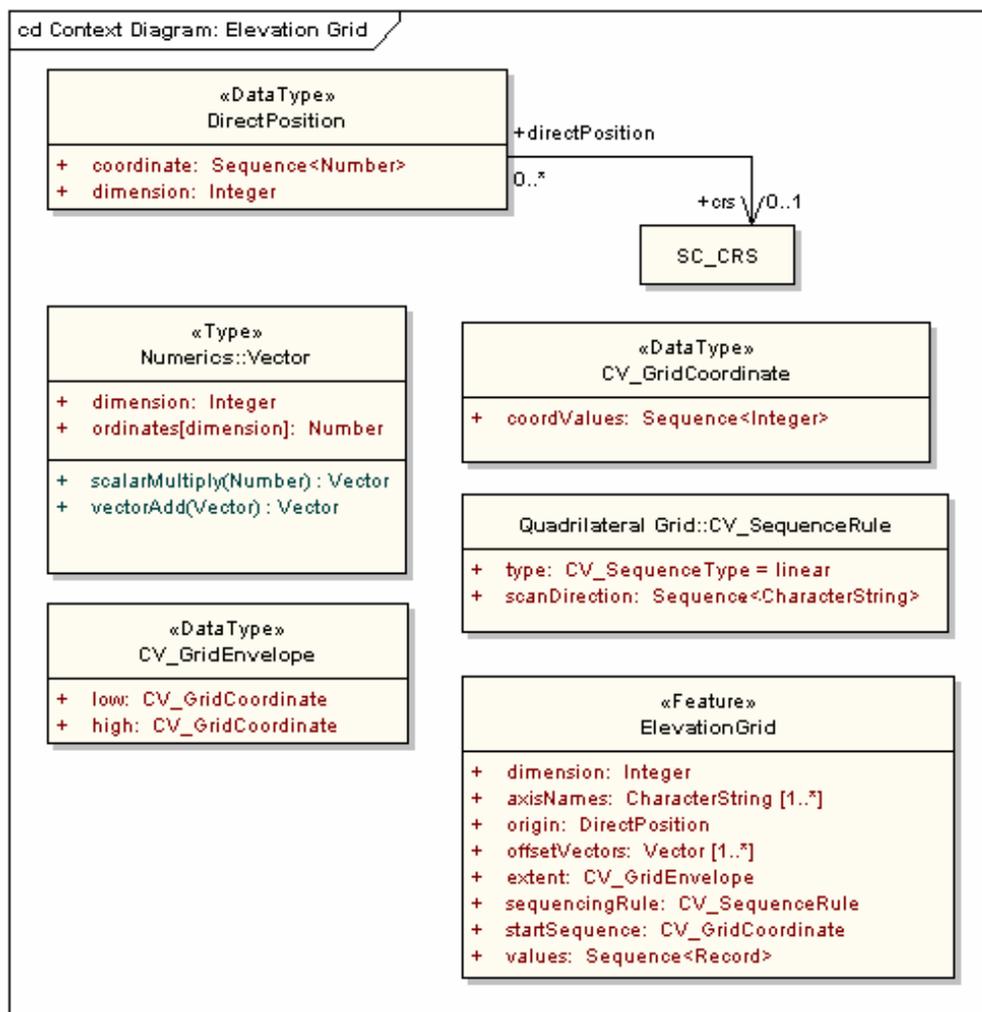

851 The attribute *profileType* shall identify the kind of profile from the code list ProfileType.

852 **A.15.4 geometry**

853 The attribute *geometry* shall contain an instance of GM\_Curve. Positions of the control points for  
854 that curve shall be described in terms of a 3D coordinate reference system. One of the  
855 coordinates shall be a value for elevation.

856 **A.16 DirectPosition**

857

858

859

Figure A.9 – DirectPosition

860

861 **A.16.1 Semantics**

862 The data type *DirectPosition*, specified in ISO 19107, is used to provide position information for  
863 all elevation values in an *ElevationCollection*.

864 **A.16.2 coordinate**

865 The attribute *coordinate* shall contain the coordinates that identify the spatial position of a point.

866 **A.16.3 dimension**

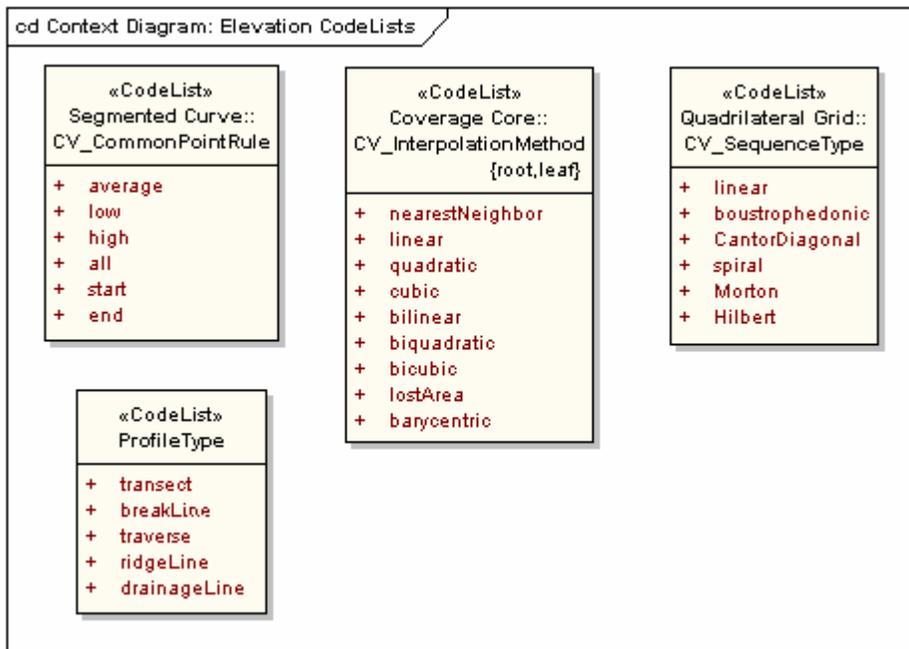

867 The attribute *dimension* is derived from the dimension of the coordinate reference system and  
868 specifies the number of ordinates included in each coordinate value.

869 **A.16.4 coordinateReferenceSystem**

870 The role name *coordinateReferenceSystem* shall identify the *SC\_CRS* to which the position is  
871 referred. *SC\_CRS* is specified in ISO 19111 as an abstract class. The appropriate subclass from  
872 ISO 19111 shall be used to describe the coordinate reference system used with any framework  
873 elevation data set.

874 **A.17 Code lists**

875

876

877

Figure A.10 – Code lists

878

879 **A.17.1 CV\_CommonPointRule code list**

880 *CV\_CommonPointRule* is a *CodeList* of values for the attribute *commonPointRule*.

881

**Table A.1 – CodeList for CV\_CommonPointRule**

| Name    | Definition |
|---------|------------|
| average |            |
| low     |            |
| high    |            |
| all     |            |
| start   |            |
| end     |            |

882

**883 A.17.2 CV\_InterpolationMethod code list**

884 CV\_InterpolationMethod is a CodeList of values for the attribute interpolationType.

885

886

**Table A.2 – CodeList for CV\_InterpolationMethod**

| Name            | Definition |
|-----------------|------------|
| nearestNeighbor |            |
| linear          |            |
| quadratic       |            |
| cubic           |            |
| bilinear        |            |
| biquadratic     |            |
| bicubic         |            |
| lostArea        |            |
| barycentric     |            |

887

**888 A.17.3 CV\_SequenceType code list**

889 CV\_SequenceType is a CodeList of values for the attribute type.

890

891

**Table A.3 – CodeList for CV\_SequenceType**

| Name            | Definition |
|-----------------|------------|
| linear          |            |
| boustrophedonic |            |
| CantorDiagonal  |            |
| spiral          |            |
| Morton          |            |

| Name    | Definition |
|---------|------------|
| Hilbert |            |

892

893 **A.17.4 ProfileType code list**

894 ProfileType is a CodeList of values for the attribute profileType.

895

896

**Table A.4 – Codelist for ProfileType**

| Name         | Definition |
|--------------|------------|
| transect     |            |
| breakLine    |            |
| traverse     |            |
| ridgeLine    |            |
| drainageLine |            |
