Overview

Geodata.gov contains a vast amount of geospatial data. With the help of a robust filtering/searching mechanism, they allow for retrieval of that data.

With the GOS Dashboard, we attempted to make things easier for the casual user. Instead of having to open a web browser to retrieve that data, you are now able to view changes in a feed form and access data of interest with a few button clicks - straight from your desktop.

Key features:

- GeoRSS data retrieval based on user filtering.
- Extensive filtering mechanism, built to mimic geodata.gov website both in style and functionality.
- Bounding box display in MS Virtual Earth map w/current RSS feed items.
- External application launching from the gadget (ex. Gaia)

Partners: US Army Corps of Engineers, The Carbon Project, NSDI Community

GOS Dashboard

The screenshot shows a Windows 7 desktop environment. In the center, a window titled "2005 Bear Controlled Hunts" is open, displaying a text description of the hunt areas and a map of Idaho. The text description includes a link to "Download Contact Details Metadata". The map shows the state of Idaho with a red and blue fish overlaid on it. The desktop background is a blue gradient with a clock in the top right corner, a weather widget showing "43°" in Burlington, MA, and a taskbar at the bottom with various icons. The system tray shows the date and time as "4:04 PM 4/6/2009".

Overview

- To create the GOS Dashboard we use the GOS Portal flexible GeoRSS feed generator. Based on the options specified by the user, a query is generated and the result are returned in a GeoRSS format.

In the GOS Dashboard options we try to mimic the website's look and feel for search & filtering as much as possible in both style in functionality, making some improvements when necessary.

- There is a server limitation of only 20 results, and those results are displayed 4 at a time, much like the default RSS gadget that comes with Windows Vista. We also emulated the default RSS styling when displaying the current feed items as well as the paging capabilities.
- The open source desktop Gadget has been tested in both Windows Vista and Window 7 and works well in both environments.

Installation

- Installation of Windows gadget is very easy. All that is required is a double click of the *GOSGadget.gadget* file and the following dialog will appear.

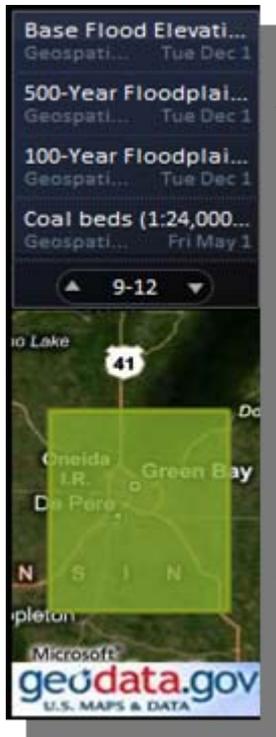

- Just click on *Install*, and the gadget will appear in your Vista sidebar. In Windows 7, there is no sidebar, so it will just appear on your desktop.

Main Viewable Area

- The main viewable area displays 4 GeoRSS feed items in a list.
- You can navigate the list by pressing the up and down arrows in the navigator. The results are limited to 20 by the server.
- On the Virtual Earth map below, the bounding boxes of each feed item are displayed (each in a different color).
- When a feed item is selected (by clicking on the title), the map will display only the current feed item bounding box.
- Double-clicking the feed title will open up the metadata in a browser window.

Main Viewable Area

List of feed items

Navigator control

Virtual Earth Map

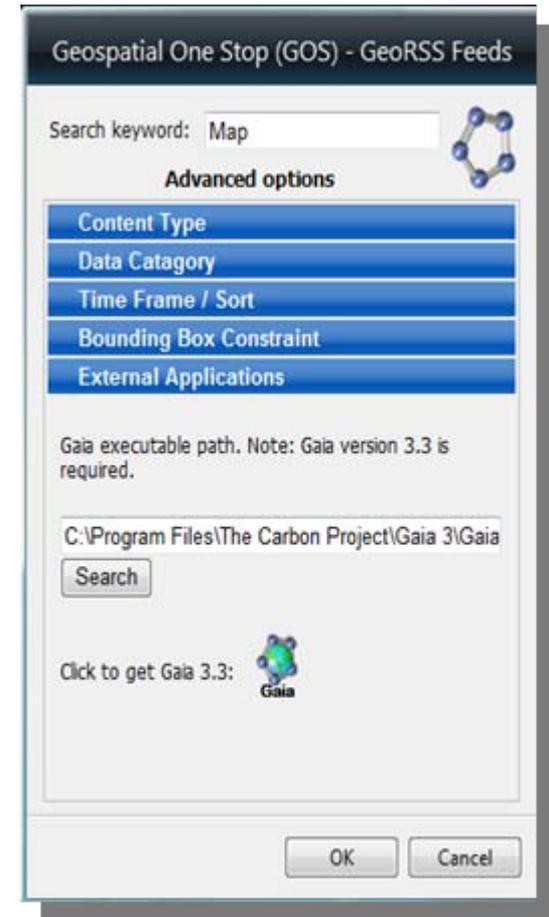

Feed Bounding Box

Note: The gadget will increase its size when undocked. In Windows 7, there is a menu option to change sizes.

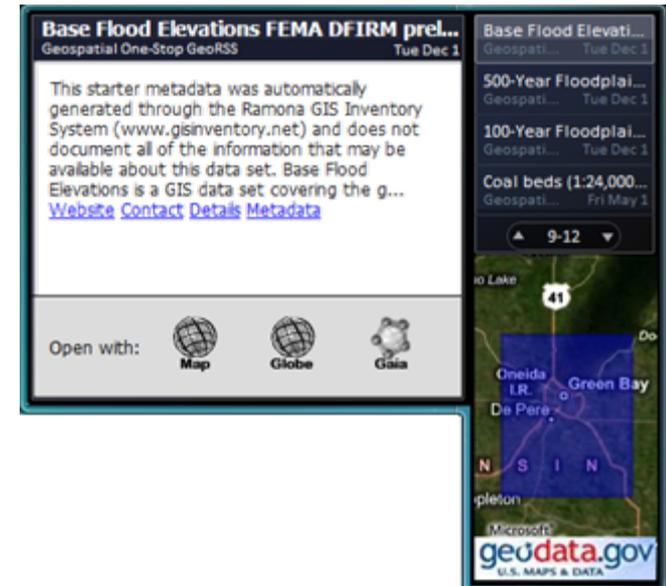

Settings

- The Settings window is where feeds search parameters are set. The top of the dialog allows keywords to be set. The keyword defaults to “map” if nothing is specified.
- The other filtering options correspond very closely to those that appear on the *geodata.gov* website. To expand a filtering section, just click on the blue header bar.
- The external applications section allows feed items to be opened up with *Gaia*. If you don't have *Gaia* installed, a link to the free download site is provided. The path settings is by default the application default installation path. The *Search* button allows an automatic detection of the *Gaia* path.

Flyout

- The flyout window appears when you click on a feed link. The flyout window displays the feed description (as sent from the server.) The description usually contains a few links that you can follow for additional information about the item.
- The icons below allow easy navigation to external services/applications that display the feed geospatial data. When not applicable the icons are grayed out.
- **Map** shows the data on a Geodata.Gov online ArcExplorer.
- **Globe** shows the data on ArcGlobe.
- **Gaia** adds the capabilities of the OGC service (if available) to the Gaia application.

Community Forum (coming soon)

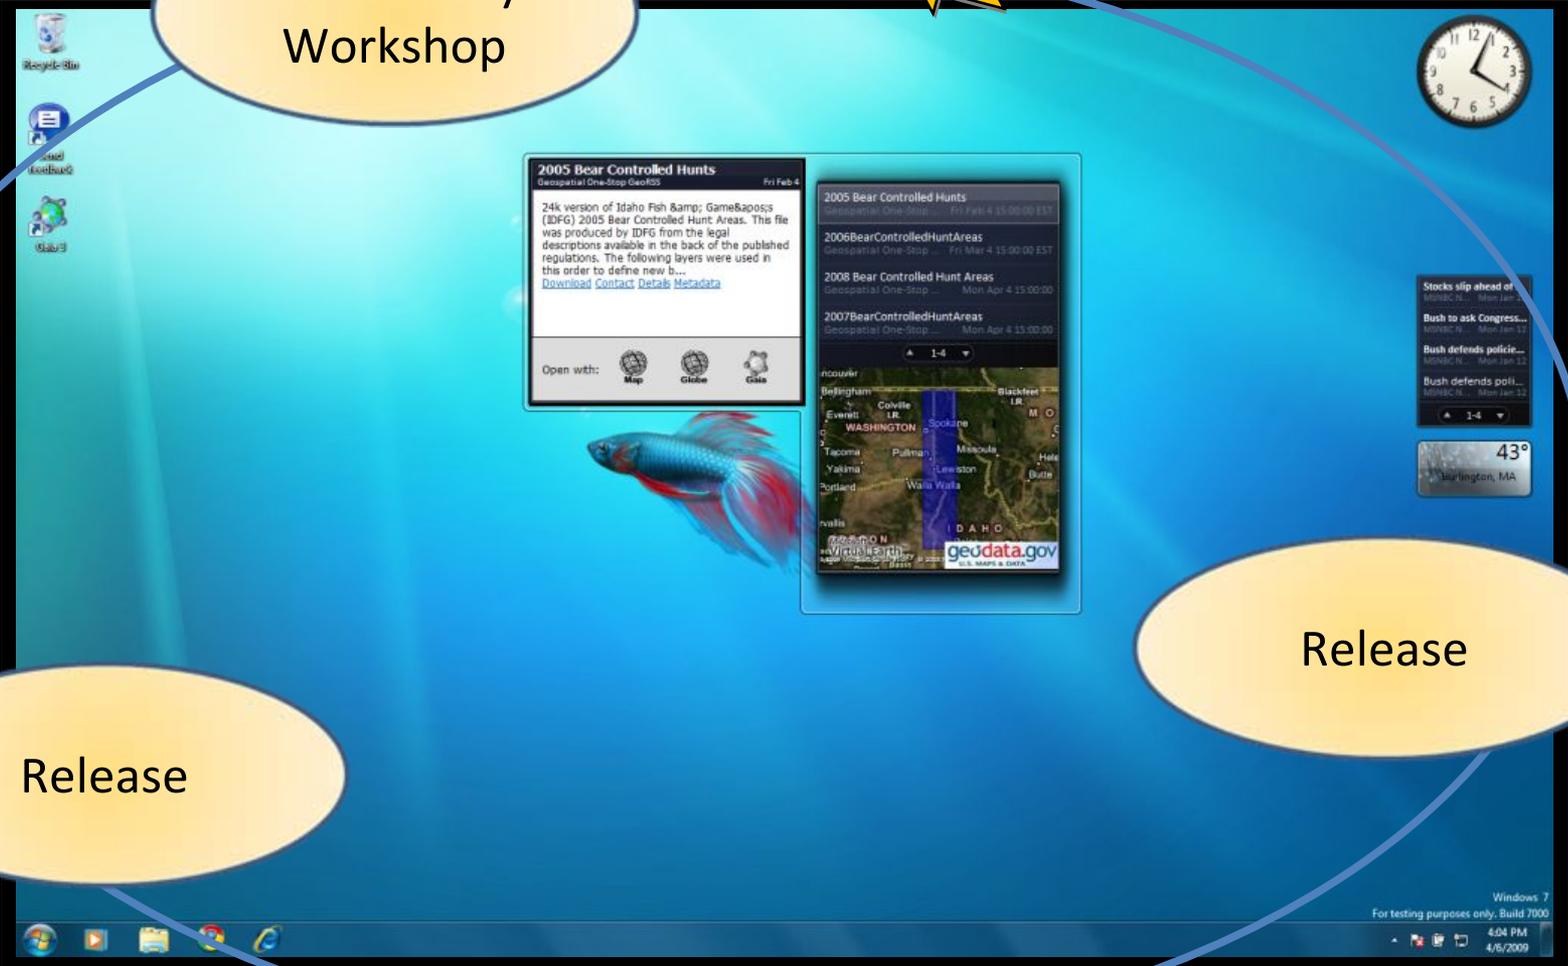

Windows 7 RC (download) has a new location API built into the operating system. This means that from within Windows your applications can access a single API that will tell you where the user is. So, till we have some killer Virtual Earth apps, in the meantime, Carbon Project have released a gadget for reading GeoRSS feeds from your desktop. The Dashboard is based on Microsoft Gadgets and enhances common RSS functions with the ability to configure searches, view geodata footprints on a mini-map, and access desktop GIS applications from ESRI and other vendors directly with the data people find. For more information about the project, check out the Carbon Cloud blog.
